Inception network was once considered a state-of-the-art deep learning architecture (or model) for solving image recognition and detection problems. (Inception Layer) is a combination of all those layers (namely, 1×1 Convolutional layer, 3×3 Convolutional layer, 5×5 Convolutional layer) with their output filter banks concatenated into a single output vector forming the input of the next stage.

In [1]:
```
#!pip install keras==2.1.2
```

In [2]:
```
import tensorflow as tf
tf.test.gpu_device_name()
```

Out[2]:
```
''
```

Data preparation

In [3]:
```
from glob import glob
from sklearn.model_selection import train_test_split

Playable = glob('train/zeldaPlayablelevels/*.jpg')
Unplayable = glob('train/zeldaUnplayablelevels/*.jpg')

Playable_train, Playable_test = train_test_split(Playable, test_size=0.30)
Unplayable_train, Unplayable_test = train_test_split(Unplayable, test_size=0.3
0)

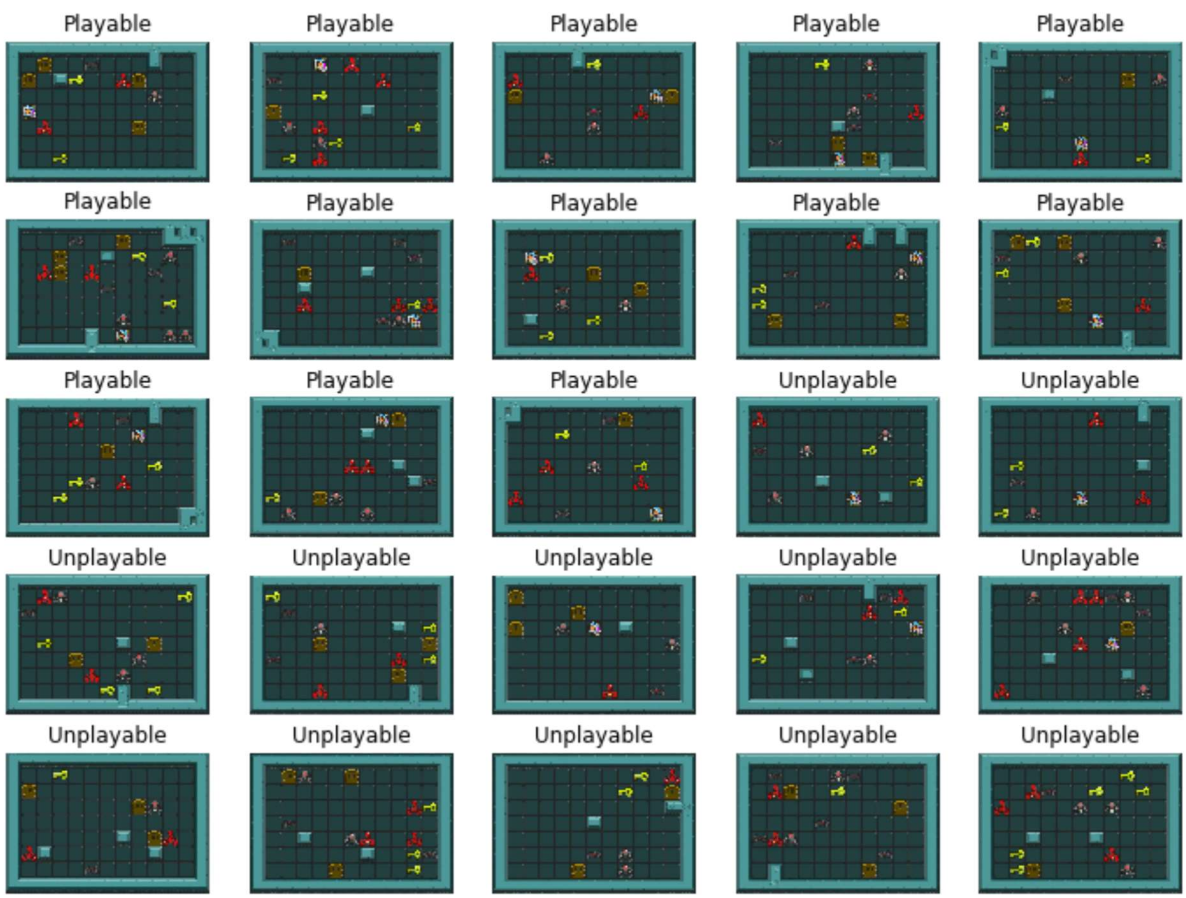
TRAIN_DIR = 'train'
TEST_DIR = 'test'
```

Plot some random images from the dataset.

In [4]:
```
import numpy as np
from PIL import Image
import matplotlib.pyplot as plt

Playable = np.random.choice(Playable_train, 13)
Unplayable = np.random.choice(Unplayable_train, 12)
data = np.concatenate((Playable, Unplayable))
labels = 13 * ['Playable'] + 12 *['Unplayable']

N, R, C = 25, 5, 5
plt.figure(figsize=(12, 9))
for k, (src, label) in enumerate(zip(data, labels)):
    im = Image.open(src).convert('RGB')
    plt.subplot(R, C, k+1)
    plt.title(label)
    plt.imshow(np.asarray(im))
    plt.axis('off')
```



Model customization

In [5]:
```
from keras.models import Model
from keras.layers import Dense, GlobalAveragePooling2D, Dropout
from keras.applications.inception_v3 import InceptionV3, preprocess_input

CLASSES = 2

# setup model
base_model = InceptionV3(weights='imagenet', include_top=False)

x = base_model.output
x = GlobalAveragePooling2D(name='avg_pool')(x)
x = Dropout(0.4)(x)
predictions = Dense(CLASSES, activation='softmax')(x)
model = Model(inputs=base_model.input, outputs=predictions)

# transfer learning
for layer in base_model.layers:
    layer.trainable = False

model.compile(optimizer='rmsprop',
              loss='categorical_crossentropy',
              metrics=['accuracy'])
```

```
Using TensorFlow backend.
```

Data augmentation

In [6]:
```
from keras.preprocessing.image import ImageDataGenerator

WIDTH = 299
HEIGHT = 299
BATCH_SIZE = 32

# data prep
train_datagen = ImageDataGenerator(
    preprocessing_function=preprocess_input,
    rotation_range=40,
    width_shift_range=0.2,
    height_shift_range=0.2,
    shear_range=0.2,
    zoom_range=0.2,
    horizontal_flip=True,
    fill_mode='nearest')

validation_datagen = ImageDataGenerator(
    preprocessing_function=preprocess_input,
    rotation_range=40,
    width_shift_range=0.2,
    height_shift_range=0.2,
    shear_range=0.2,
    zoom_range=0.2,
    horizontal_flip=True,
    fill_mode='nearest')

train_generator = train_datagen.flow_from_directory(
    TRAIN_DIR,
    target_size=(HEIGHT, WIDTH),
        batch_size=BATCH_SIZE,
        class_mode='categorical')

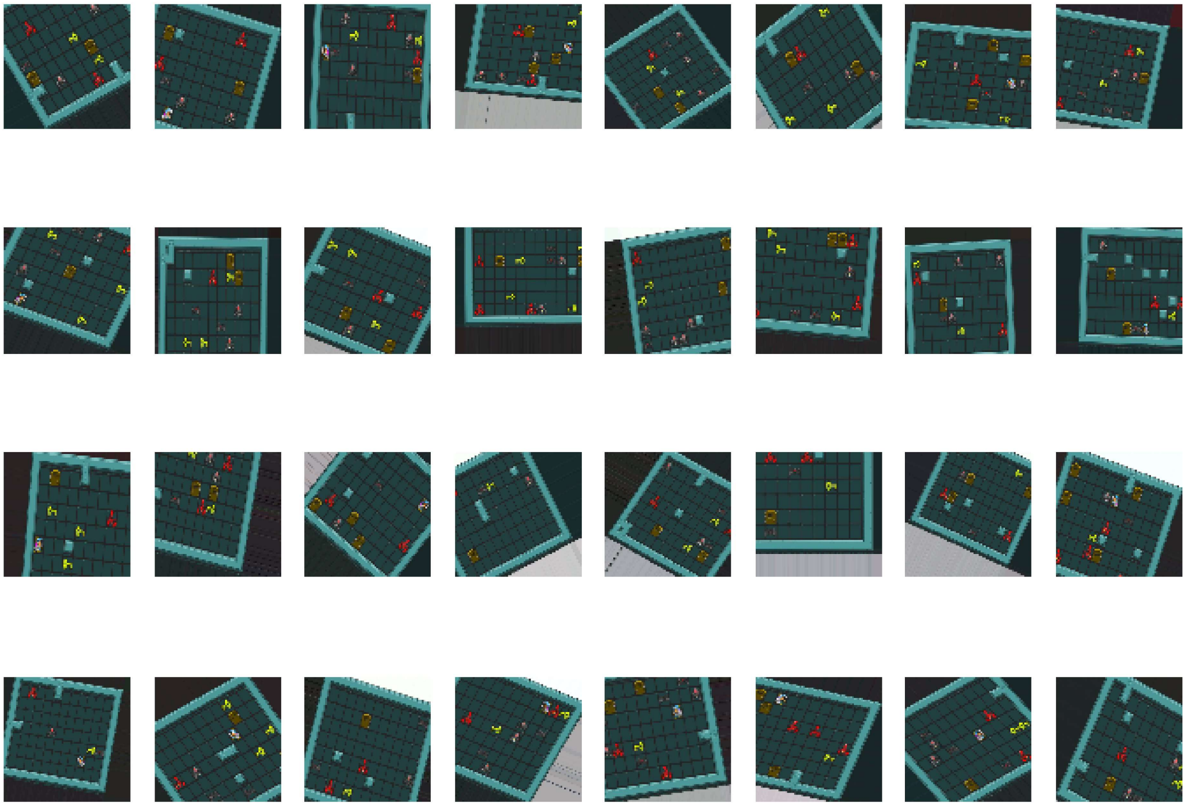
validation_generator = validation_datagen.flow_from_directory(
    TEST_DIR,
    target_size=(HEIGHT, WIDTH),
    batch_size=BATCH_SIZE,
    class_mode='categorical')
```

```
Found 2018 images belonging to 2 classes.
Found 30 images belonging to 2 classes.
```

Plot some images result of data augmentation.

In [7]:
```
x_batch, y_batch = next(train_generator)

plt.figure(figsize=(12, 9))
for k, (img, lbl) in enumerate(zip(x_batch, y_batch)):
    plt.subplot(4, 8, k+1)
    plt.imshow((img + 1) / 2)
    plt.axis('off')
```



Transfer learning

In [8]:

```
EPOCHS = 10

img_height = 299
```

Predict classes

In [16]:

```
test_generator = ImageDataGenerator()
test_data_generator = test_generator.flow_from_directory(
    TEST_DIR, # Put your path here
    target_size=(img_width, img_height),
    batch_size=32,
    shuffle=False)
test_steps_per_epoch = numpy.math.ceil(test_data_generator.samples / test_data
_generator.batch_size)

predictions = model.predict_generator(test_data_generator, steps=test_steps_pe
r_epoch)
# Get most likely class
predicted_classes = numpy.argmax(predictions, axis=1)
```

```
Found 30 images belonging to 2 classes.
```

Get ground-truth classes and class-labels

In [17]:

```
true_classes = test_data_generator.classes
class_labels = list(test_data_generator.class_indices.keys())
```

Use scikit-learn to get statistics

In [19]:

```
import sklearn.metrics as metrics
report = metrics.classification_report(true_classes, predicted_classes, target
_names=class_labels)
print(report)
```

```
